

The Endura Tanker Loader

Optimised for transit loading

Transit Loading

Effortless integration with complex applications and sites

Floveyor has been designing, engineering, and manufacturing conveyors and process line technology in Western Australia since 1958.

Floveyor's Endura range of conveyors is designed to accommodate sophisticated chemical and industrial applications with a focus on longevity and reliability. The Endura Tanker Loader is a specially engineered materials handling solution for transit loading, making the logistical operations of bulk material handling faster, safer and more economical.

Why choose the Endura range from Floveyor?

- Safely and rapidly transfer abrasive, hazardous, and volatile powders and granules
- Protect your operators and site from dust during the decanting process
- Maximise uptime while reducing maintenance requirements

FloDisc® Technology

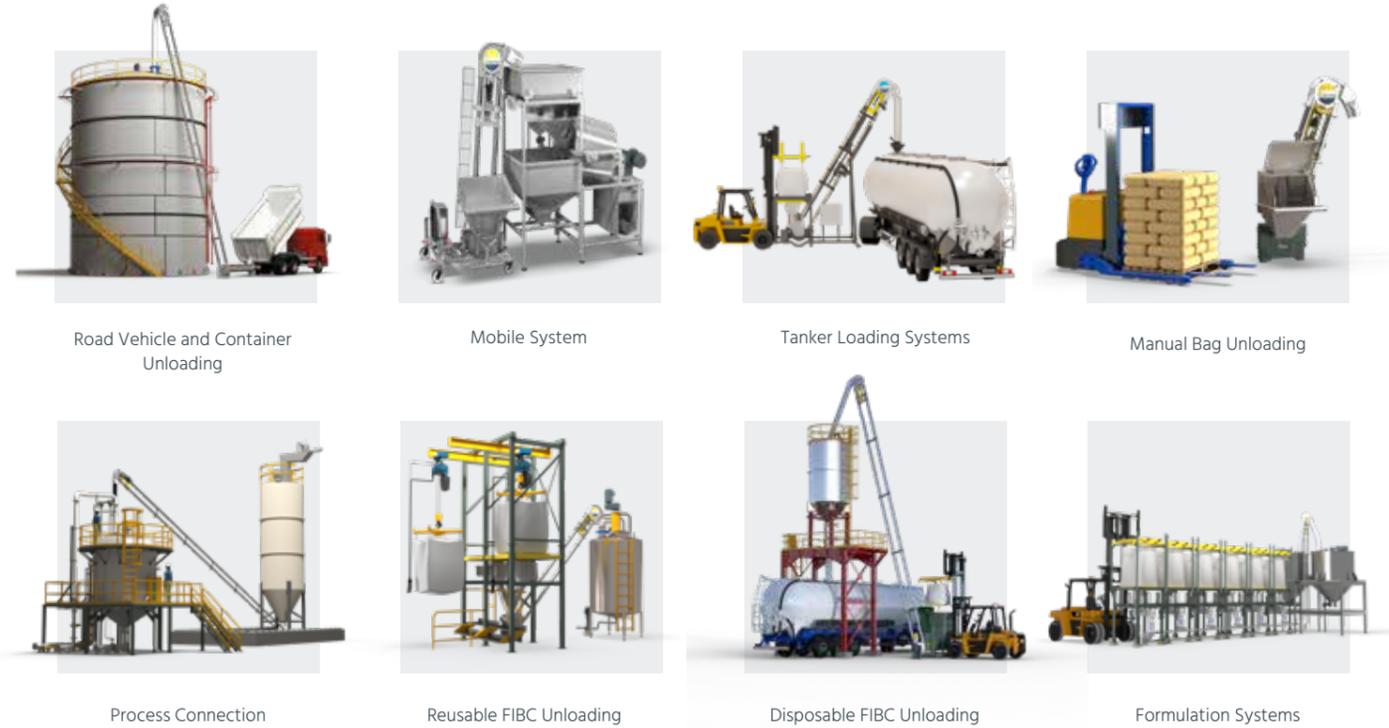

Floveyor's proprietary FloDisc technology uses centrifugal force to suspend raw materials in an air pocket in an enclosed tube and propel them to a collection point. This provides a rapid but gentle way to transfer materials.

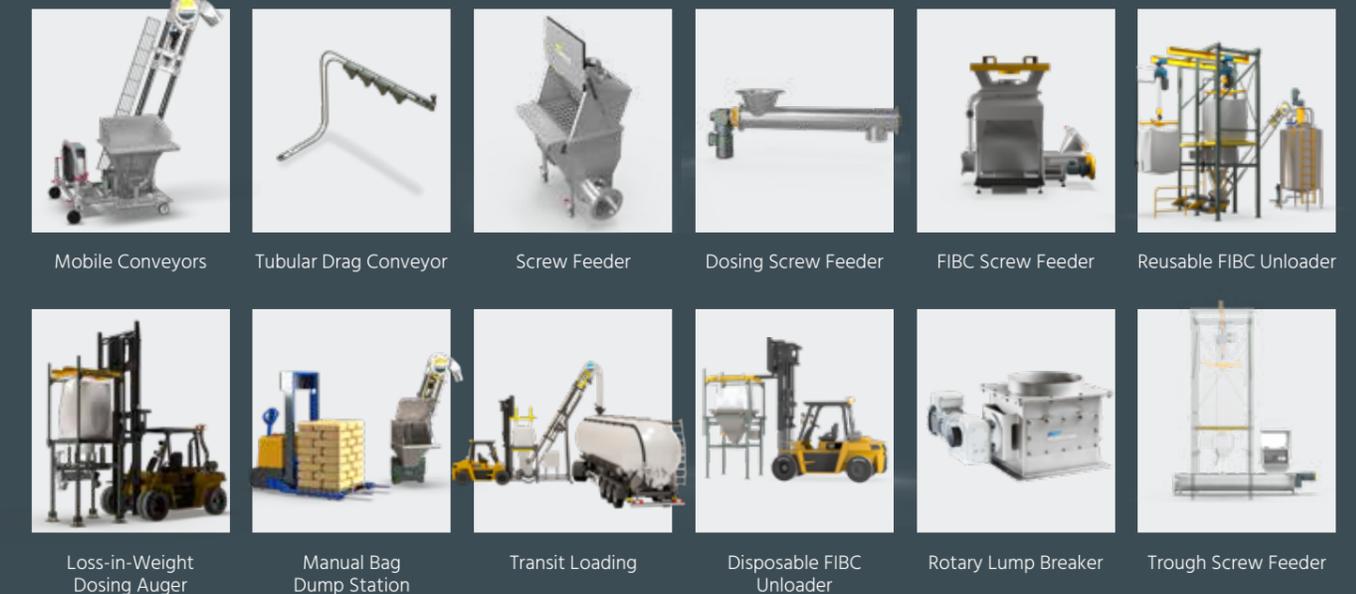

“Only Floveyors with FloDisc technology convey powders and granules so efficiently and safely.”

Choose your method of bulk material delivery

Floveyor conveyors work in an unlimited number of process and plant configurations.

A vast range of accessories combined with optional ATEX/Ex compliance features provides effortless integration to brownfield sites while meeting rigorous global compliance and safety standards.

See our Endura Tanker Loader fact sheet for more detail about each solution.

Process line technology for tanker loading and decanting

Floveyor provides process line technology for the bulk materials handling of industrial manufacturing, chemical and resources applications. Every Floveyor conveyor in the Endura range is designed to make vast improvements in how bulk materials are handled when discharging into road tankers.

- Transfer raw materials into pneumatic road tankers at a high transfer rate – only gravity silos can do it faster.
- Faster, cleaner transfers at a reduced cost.
- Mobility for multiple products, remote locations or sites with limited space or difficult access.
