

# Floveyor Tubular Drag Conveyor

Introducing the next evolution in multi-outlet, multi-plane process line technology.

Floveyor's trademark versatility provides a new process line technology solution for multi-outlet material distribution and transfer.

Designed exclusively for better powder handling of free-flowing, dry, low-friction powders and granules. The Floveyor Tubular Drag Conveyor is perfect for pet food, animal nutrition, and food and beverage applications.

# Choose your plant layout requirements

The Floveyor Tubular Drag Conveyor (FTDC) provides gentle material handling, an enclosed dust-free environment, easy maintenance and low energy consumption. It also meets the needs of complex routes over multiple planes, reduced clearances and multiple outlets.

## Horizontal

Achieving the longest permissible conveying distance, a straight-line horizontal path is a simple solution to distribute materials to a variety of hoppers, siloes or reactors along a production environment.

## Horizontal Corners

Similar to the horizontal system, with the additional ability to accommodate 30°, 45°, 60°, 75° and 90° corners as required.

## Multi-Level Elevation

With the addition of sweeping radius corners, the FTDC process line technology is able to transport materials across multiple planes and floors, with minimal clearance requirements.

## Multi-Level Elevation Return

With the ability to use a variety of radius corners, the FTDC can be installed in numerous layouts.

## Complex Route

The flexibility of the FTDC allows the conveyor to be installed along a variety of complex routes and paths throughout a plant, allowing minimal site requirements to accommodate the system.

## Loop

The FTDC is only limited to a maximum rope assembly length. Loop systems can be used to ensure the efficient transfer of materials through tight routes, reducing the overall rope assembly length when compared to a parallel tube installation.

## Transfer

Multiple FTDCs or Floveyor Aero-Mechanical Conveyors (AMC) can be joined together to accommodate a variety of plant limitations and requirements.

Elevate and  
distribute materials  
with precision.
